Windows Server 2019 - VMware Workstation
Windows Deployment Services
Windows Deployment Services Configuration Wizard
Before You Begin
You can use this wizard to configure Windows Deployment Services. Once the server is configured, you will need to add at least one boot image and one install image to the server before you will be able to install an operating system.
Before you begin, ensure that the following requirements are met:
The server is a member of an Active Directory Domain Services (AD DS) domain, or a domain controller for an AD DS domain. If the server supports Standalone mode, it can be configured without having a dependency on Active Directory.
There is an active DHCP server on the network. This is because Windows Deployment Services uses Pre-Boot Execution Environment (PXE), which relies on DHCP for IP addressing.
There is an active DNS server on your network.
This server has an NTFS file system partition on which to store images.
To continue, click Next.

Windows Server 2019 - VMware Workstation
Windows Deployment Services
Windows Deployment Services Configuration Wizard
PXE Server Initial Settings
You can use these settings to define which client computers this server will respond to. Known clients are the clients that have been prestaged. When the physical computer performs a PXE boot, the operating system will be installed based on the settings that you have defined.
Select one of the following options:
Do not respond to any client computers
Respond only to known client computers
Respond to all client computers (known and unknown)
Require administrator approval for unknown computers. When you select this option, you must approve the computers using the Pending Devices node in the snap-in. Approved computers will be added to the list of prestaged clients.
To configure this server, click Next.
